

TECHNOLOGY / THE FOUNDATIONS

Every large infrastructure rests on a few *transversal foundations*.

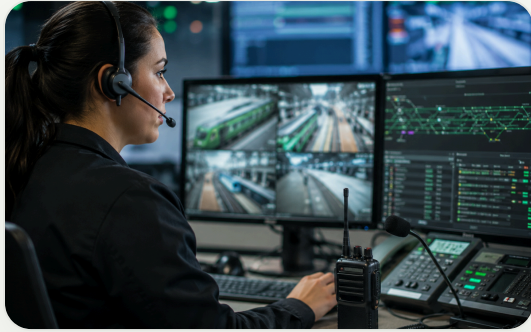

Two of them carry everything: the data centre, where all the information is stored, and the transport backbone — the wired and wireless network the data travels on. Cybersecurity is not a third foundation; it is a cover over them all, built into the design of every layer.

On the transversal foundations, *the systems we integrate*.

On top of these foundations live and travel diverse services — voice communications, information between users, security and control. Within these blocks sit all the systems we integrate, with well-defined interfaces so they work as one.

01 COMMUNICATIONS

Telephony & intercom

Voice for the operation and the public.

Critical wireless voice

TETRA/P25, LTE/5G and MCPTT for mobility.

02 INFORMATION

Public information & WiFi

PA, passenger-information screens and public WiFi.

Digital signage

Advertising and real-time content on screens.

03 SAFETY

Video surveillance (CCTV)

Cameras with video analytics and compliant recording.

Access control & intrusion

Sensitive premises and perimeter, multiple...

Security integration (PSIM)

Every security system in a single operator HMI.

04 CONTROL & MAINTENANCE

Control & supervision

SCADA, HVAC, lighting, power.

Elevators & escalators

Monitoring and status across fleet.

Fire detection

Detection and alarm interfaces.

adderein

Adding Value Together

Communications, control & cybersecurity engineering for railway, airport and public-infrastructure environments. *Adding value together.*
